6.3 Design Consideration

Below listed some of the design considerations while integrating the M.2 card to the system.

1. BDE recommends using double-shielded coaxial RF cable to connect with the U.FL connector with antenna;
2. Do not place or run the RF cable right above or below the card or module;
3. Consider the enclose materials. Do not place the antenna close to the metal;
4. Do not place high speed signal beneath the card;
5. If there are some other radio besides this card in the system, try to place them apart as far as possible. And Ensure there is at least 25 dB isolation between the antenna port of every radio;
6. Make VDD_3V3 traces as short as possible and as wide as possible to reduce the inductance and resistance of the traces, 40mil as least is recommended;
7. Proper decoupling capacitors are recommended for the card;
8. Proper ESD protection is recommended while installing the card to the host carrier board;
9. SDIO signals traces (CLK, CMD, DO, 01, 02, and 03) must be routed in parallel to each other and as short as possible (less than 12 cm). In addition, every trace length must be the same as the others. There should be enough space between traces- greater than 1.5 times the trace width or ground- to ensure signal quality, especially for the SDIO_CLK trace. Remember to keep these traces away from the other digital or analog signal traces. BDE recommends adding ground shielding around these buses;
10. SDIO and digital clock signals are a source of noise. Keep the traces of these signals as short as possible. If possible, maintain a clearance around them;
